

## EXERCISE 2.9

**Q.1:** Determine the intervals in which  $f$  is increasing or decreasing for the domain mentioned in each case.

- (i)  $f(x) = \sin x$  ;  $x \in (-\pi, \pi)$   
 (ii)  $f(x) = \cos x$  ;  $x \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$  (L.B 2005)  
 (iii)  $f(x) = 4 - x^2$  ;  $x \in (-2, 2)$   
 (iv)  $f(x) = x^2 + 3x + 2$  ;  $x \in (-4, 1)$

**Solution:**

$$f(x) = \sin x \quad ; \quad x \in (-\pi, \pi)$$

$$f'(x) = \cos x$$

Put

$$f'(x) = 0$$

$$\Rightarrow \cos x = 0$$

$$\Rightarrow x = \frac{-\pi}{2}, \frac{\pi}{2}$$

So the sub-intervals are

$$\left(-\pi, \frac{-\pi}{2}\right), \left(\frac{-\pi}{2}, \frac{\pi}{2}\right), \left(\frac{\pi}{2}, \pi\right)$$

For  $\left(-\pi, \frac{-\pi}{2}\right)$

$$f'(x) = \cos x < 0 \quad \text{in} \left(-\pi, \frac{-\pi}{2}\right)$$

$$\text{So } f(x) \text{ is decreasing in } \left(-\pi, \frac{-\pi}{2}\right)$$

For  $\left(\frac{-\pi}{2}, \frac{\pi}{2}\right)$

$$f'(x) = \cos x > 0 \quad \text{in} \left(\frac{-\pi}{2}, \frac{\pi}{2}\right)$$

$$\text{So } f(x) \text{ is increasing in } \left(\frac{-\pi}{2}, \frac{\pi}{2}\right)$$

For  $\left(\frac{\pi}{2}, \pi\right)$

$$f'(x) = \cos x < 0 \quad \text{in } \left(\frac{\pi}{2}, \pi\right)$$

So  $f(x)$  is decreasing in  $\left(\frac{\pi}{2}, \pi\right)$

$$(ii) \quad f(x) = \cos x \quad ; \quad x \in \left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$$

$$f'(x) = -\sin x$$

Put

$$f'(x) = 0$$

$$\sin x = 0$$

$$x = 0$$

So the sub-intervals are  $\left(-\frac{\pi}{2}, 0\right)$ ,  $\left(0, \frac{\pi}{2}\right)$

For  $\left(-\frac{\pi}{2}, 0\right)$

$$f'(x) = -\sin x > 0 \quad \text{in } \left(-\frac{\pi}{2}, 0\right)$$

So  $f$  is increasing in  $\left(-\frac{\pi}{2}, 0\right)$

For  $\left(0, \frac{\pi}{2}\right)$

$$f'(x) = -\sin x < 0 \quad \text{in } \left(0, \frac{\pi}{2}\right)$$

So  $f$  is decreasing in  $\left(0, \frac{\pi}{2}\right)$

$$(iii) \quad f(x) = 4 - x^2 \quad ; \quad x \in (-2, 2) \quad \textbf{(L.B 2008)}$$

$$f'(x) = -2x$$

Put

$$f'(x) = 0$$

$$-2x = 0$$

$$x = 0$$

So the sub-intervals are  $(-2, 0)$  and  $(0, 2)$

For  $(-2, 0)$

$$f'(x) = -2x > 0 \quad \text{in } (-2, 0)$$

So  $f(x)$  is increasing in  $(-2, 0)$

For  $(0, 2)$

$$f'(x) = -2x < 0 \quad \text{in } (0, 2)$$

So  $f(x)$  is decreasing in  $(0, 2)$

$$(iv) \quad f(x) = x^2 + 3x + 2 \quad ; \quad x \in (-4, 1) \quad (L.B \ 2007) \ (G.B \ 2008)$$

$$f'(x) = 2x + 3$$

$$\text{Put } f'(x) = 0$$

$$2x + 3 = 0$$

$$2x = -3$$

$$x = \frac{-3}{2}$$

So the sub-intervals are  $\left(-4, \frac{-3}{2}\right), \left(\frac{-3}{2}, 1\right)$

$$\text{For } \left(-4, \frac{-3}{2}\right)$$

$$f'(x) = 2x + 3 < 0 \quad \text{in } \left(-4, \frac{-3}{2}\right)$$

So  $f(x)$  is decreasing in  $\left(-4, \frac{-3}{2}\right)$

$$\text{For } \left(\frac{-3}{2}, 1\right)$$

$$f'(x) = 2x + 3 > 0 \quad \text{in } \left(\frac{-3}{2}, 1\right)$$

So  $f(x)$  is increasing in  $\left(\frac{-3}{2}, 1\right)$

**Q.2: Find the extreme values of the following functions defined as**

$$(i) \quad f(x) = 1 - x^3$$

$$(ii) \quad f(x) = x^2 - x - 2$$

$$(iii) \quad f(x) = 5x^2 - 6x + 2$$

$$(iv) \quad f(x) = 3x^2$$

$$(v) \quad f(x) = 3x^2 - 4x + 5$$

$$(vi) \quad f(x) = 2x^3 - 2x^2 - 36x + 3$$

$$(vii) \quad f(x) = x^4 - 4x^2$$

$$(viii) \quad f(x) = (x - 2)^2 (x - 1)$$

$$(ix) \quad f(x) = 5 + 3x - x^3 \quad (L.B \ 2011)$$

**Solution:**

$$(i) \quad f(x) = 1 - x^3$$

$$f'(x) = -3x^2$$

$$f''(x) = -6x$$

For stationary points

$$\text{Put } f'(x) = 0$$

$$-3x^2 = 0$$

$$x^2 = 0$$

$$x = 0$$

The second derivative does not help in determining the extreme values.

Before  $x = 0$  ,  $f'(x) < 0$

After  $x = 0$  ,  $f'(x) < 0$

$\therefore x = 0$  has a point of inflection.

Put

$$x = 0 \text{ in}$$

$$f(x) = 1 - x^3$$

$$f(0) = 1 - (0)^3 = 1$$

$\therefore$  Point of inflection is (0, 1)

(ii)  $f(x) = x^2 - x - 2$

$$f'(x) = 2x - 1$$

$$f''(x) = 2$$

For stationery points

Put  $f'(x) = 0$

$$2x - 1 = 0$$

$$2x = 1$$

$$x = \frac{1}{2}$$

Put  $x = \frac{1}{2}$  in  $f''(x)$ , we get

$$f''\left(\frac{1}{2}\right) = 2 > 0$$

$\therefore$   $f$  has relative minima at  $x = \frac{1}{2}$

Put  $x = \frac{1}{2}$  in

$$f(x) = x^2 - x - 2$$

$$f\left(\frac{1}{2}\right) = \left(\frac{1}{2}\right)^2 - \frac{1}{2} - 2$$

$$= \frac{1}{4} - \frac{1}{2} - 2$$

$$= \frac{1 - 2 - 8}{4} = \frac{-9}{4}$$

Ans.

(iii)

(L.B 2009 (s)) (L.B 2009)

$$f(x) = 5x^2 - 6x + 2$$

$$f'(x) = 10x - 6$$

$$f''(x) = 10$$

For stationary points

Put

$$f'(x) = 0$$

$$10x - 6 = 0$$

$$10x = 6$$

$$x = \frac{6}{10}$$

$$= \frac{3}{5}$$

Put

$$x = \frac{3}{5} \text{ in } f''(x), \text{ we get}$$

$$f''\left(\frac{3}{5}\right) = 10 > 0$$

 $\therefore$  f has relative minima at  $x = \frac{3}{5}$ Put  $x = \frac{3}{5}$  in

$$f(x) = 5x^2 - 6x + 2$$

$$f\left(\frac{3}{5}\right) = 5\left(\frac{3}{5}\right)^2 - 6\left(\frac{3}{5}\right) + 2$$

$$= 5\left(\frac{9}{25}\right) - \frac{18}{5} + 2$$

$$= \frac{9}{5} - \frac{18}{5} + 2$$

$$= \frac{9 - 18 + 10}{5}$$

$$\boxed{f\left(\frac{3}{5}\right) = \frac{1}{5}}$$

Ans

$$(iv) \quad f(x) = 3x^2$$

$$f'(x) = 6x$$

$$f''(x) = 6$$

For stationary points

$$\text{Put } f'(x) = 0$$

$$6x = 0$$

$$x = 0$$

Put  $x = 0$  in  $f''(x)$ , we get

$$f''(0) = 6 > 0$$

$\therefore$   $f$  has relative minima at  $x = 0$

$$= \frac{2}{3}$$

Put  $x = \frac{2}{3}$  in  $f''(x)$ , we get

$$f''\left(\frac{2}{3}\right) = 6 > 0$$

$\therefore$   $f$  has relative minima at  $x = \frac{2}{3}$

Put  $x = \frac{2}{3}$  in

$$f(x) = 3x^2 - 4x + 5$$

$$\begin{aligned}

$$x = \frac{1 \pm \sqrt{55}}{3}$$

$$x = e$$

$$\because \ln e = 1$$

Put  $x = e$  in  $\frac{d^2y}{dx^2}$ , we get

$$\frac{d^2y}{dx^2} = \frac{-3e + 2e}{e^4}$$

$$= \frac{-e}{e^4}$$

$$= \frac{-1}{e^3} < 0$$

Shows  $y = \frac{\ln x}{x}$  has maximum value at  $x = e$ .

**Q.5:** Show that  $y = x^x$  has a minimum value at  $x = \frac{1}{e}$  (L.B 2006)

**Solution:**

$$y = x^x$$

Taking 'ln' on both sides

$$\ln y = \ln x^x$$

$$\ln y = x \ln x$$

$$\frac{1}{y} \cdot \frac{dy}{dx} = x \cdot \frac{1}{x} + \ln x \cdot 1$$

$$\frac{dy}{dx} = y [1 + \ln x]$$

$$\frac{dy}{dx} = x^x (1 + \ln x)$$

$$\frac{d^2y}{dx^2} = x^x \frac{d}{dx} (1 + \ln x) + (1 + \ln x) \frac{d}{dx} (x^x)$$

$$\frac{d^2y}{dx^2} = x^x \cdot \frac{1}{x} + (1 + \ln x) \cdot x^x (1 + \ln x)$$

$$\frac{d^2y}{dx^2} = x^x \left[ \frac{1}{x} + (1 + \ln x)^2 \right]$$

For stationary points

Put  $\frac{dy}{dx} = 0$

$$x^x (1 + \ln x) = 0$$

$$1 + \ln x = 0, \quad x^x \neq 0$$

$$\ln e + \ln x = 0$$

$$\ln x = -\ln e$$

$$\ln x = \ln e^{-1}$$

$$x = e^{-1}$$

$$x = \frac{1}{e}$$

Put  $x = \frac{1}{e}$  in  $\frac{d^2y}{dx^2}$ , we get

$$\frac{d^2y}{dx^2} = \left(\frac{1}{e}\right)^{\frac{1}{e}} \left[ \frac{1}{\frac{1}{e}} + \left(1 + \ln \frac{1}{e}\right)^2 \right]$$

$$\frac{d^2y}{dx^2} = \left(\frac{1}{e}\right)^{\frac{1}{e}} [e + (1 + \ln e^{-1})^2]$$

$$\frac{d^2y}{dx^2} = \left(\frac{1}{e}\right)^{\frac{1}{e}} [e + (1 - \ln e)^2]$$

$$\frac{d^2y}{dx^2} = \left(\frac{1}{e}\right)^{\frac{1}{e}} [e + (1 - 1)^2]$$

$$\frac{d^2y}{dx^2} = e \left(\frac{1}{e}\right)^{\frac{1}{e}} > 0$$

Shows  $y = x^x$  has a minimum value at  $x = \frac{1}{e}$
